

Belt Drive Preventive Maintenance & Safety Manual

Severe or Abnormal V-Belt Wear

Symptoms	Probable Cause	Corrective Action
Wear on top surface of belt	 Rubbing against guard Idler malfunction 	 Replace or repair guard. Replace idler.
Wear on top corner of belt	 Belt-to-sheave fit incorrect (belt too small for groove) 	1. Use correct belt-to-sheave combination.
	ŧ	
Wear on belt sidewalls	1. Belt slip	1. Retention until slipping stops.
	2. Misalignment	2. Realign sheaves.
	3. Worn sheaves	3. Replace sheaves.
	4. Incorrect belt	4. Replace with correct belt size.
 Wear on bottom corner of belt 	1. Belt-to-sheave fit incorrect	1. Use correct belt-to-sheave com- bination.
	2. Worn sheaves	2. Replace sheaves.
Wear on bottom surface of belt	1. Belt bottoming on sheave groove	1. Use correct belt/sheave match.
	2. Worn sheaves	2. Replace sheaves.
and the local second	3. Debris in sheaves	3. Clean sheaves.
 Undercord cracking 	1. Sheave diameter too small	1. Use larger diameter sheaves.
0	2. Belt slip	2. Retention.
	3. Backside idler too small	 Use larger diameter backside idler.
	4. Improper storage	 Don't coil belt too tightly, kink or bend.Avoid heat and direct sun- light.

Severe or Abnormal V-Belt Wear-cont.

Symptoms	Probable Cause	Corrective Action
 Undercord or sidewall burn or hardening 	 Belt slipping Worn sheaves Underdesigned drive Shaft movement 	 Retension until slipping stops. Replace sheaves. Refer to DNA drive manual. Check for center distance changes.
Belt surface hard or stiff	1. Hot drive environment	1. Improve ventilation to drive.
 Belt surface flaking, sticky or swollen 	1. Oil or chemical contamination	 Do not use belt dressing. Eliminate sources of oil, grease or chemical contamination.

V-Belts Turn Over or Come Off Drive

Symptoms	Probable Cause	Corrective Action
Involves single or multiple belts	1. Shock loading or vibration	 Check drive design. Shield grooves and drive.
		3. Realign the sheaves.
No. of Concession, Name of Con Name of Concession, Name of Concess	Foreign material in grooves	4. Replace sheaves.
Contraction of the Contraction o	Misaligned sheaves	5. Use correct installation and belt
	4. Worn sheave grooves	storage procedure.
	5. Damaged tensile member	Carefully align flat idler on slack side of drive as close as possi-
	Incorrectly placed flat idler	ble to driveR sheaves.
	7. Mismatched belt set	 Replace with new set of matched belts.Do not mix old and new belts.
		 Check for center distance stabili- ty and vibration dampening.
	8. Poor drive design	

Belt Stretches Beyond Available Take-Up

Symptoms	Probable Cause	Corrective Action
Multiple belts stretch unequally	 Misaligned drive Debris in sheaves 	 Realign and retension drive. Clean sheaves.
	 Broken tensile member or cord damaged 	3. Replace all belts, install properly.
	4. Mismatched belt set	4. Install matched belt set.
 Single belt, or where all belts stretch evenly 	1. Insufficient take-up allowance	 Check take-up. Use allowance specified in DNA design manuals.
	 Grossly overloaded or under designed drive 	2. Redesign drive.
	3. Broken tensile members	3. Replace belt, install properly.
Belt Noise		
Symptoms	Probable Cause	Corrective Action
Belt squeals or chirps	1. Belt slip	1. Retension.
	2. Contamination	2. Clean belts and sheaves.
Slapping Sound	1. Loose belts	1. Retension.
	2. Mismatched set	Install matched belt set.
	3. Misalignment	 Realign pulleys so all belts share load equally.
Rubbing sound	1. Guard interference	1. Repair, replace or redesign guard.
Grinding sound	1. Damaged bearings	1. Replace, align & lubricate.
Unusually loud drive	1. Incorrect belt	 Use correct belt size. Use cor- rect belt tooth profile for sprock- ets on synchronous drive.
	2. Incorrect Tension	2. Check tension and adjust
	3. Worn sheaves	Replace sheaves
	4. Debris in sheaves	 Clean sheaves, improve shield- ing, remove rust, paint, or remove dirt from grooves.

Unusual Vibration

Symptoms	Probable Cause	Corrective Action
Belts flopping	 Loose belts (under tensioned) Mismatched belts Pulley misalignment 	 Retension. Install new matched set. Align pulley
Unusual or excessive vibration	1. Incorrect belt	 Use correct belt cross section in pulley. Use correct tooth profile and pitch in sprocket.
	 Poor machine or equipment design 	Check structure and brackets for adequate strength.
	3. Pulley out of round	3. Replace with non-defective pulley.
	4. Loose drive components	 Check machine components and guards, motor mounts, motor pads, bushings, brackets and framework for stability adequate design strength, proper mainte- nance and proper installation.

Problems With Sheaves

Symptoms	Probable Cause	Corrective Action
Broken or damaged sheave	1. Incorrect sheave installation	 Do not tighten bushing bolts beyond recommended torque values.
	2. Foreign objects falling into drive	2. Use adequate drive guard.
	3. Excessive rim speeds	3. Keep pulley rim speeds below maximum recommended value.
	4. Incorrect belt installation	4. Do not pry belts onto pulleys.
Severe Groove Wear	1. Excessive belt tension	1. Retension, check drive design.
	2. Sand, debris or contamination	 Clean and shield drive as well as possible.
	3. Wrong belt	3. Make sure belt and sheave com- bination is correct.

Problem With Other Drive Components

Symptoms	Probable Cause	Corrective Action
 Bent or broken shaft 	1. Extreme belt overtension	1. Retension
	2. Overdesigned drive*	Check drive design, may need to use smaller or fewer belts.
	3. Accidental damage	3. Redesign drive guard.
	4. Machine design error	4. Check machine design.
	Accidental damage to guard or poor guard design	5. Repair, redesign for durability.
	Pulley mounted too far away from outboard bearing	6. Move pulley closer to bearing.

Hot Bearings

Symptoms	Probable Cause	Corrective Action
Drive needs overtensioning	 Worn grooves - belts bottoming and won't transmit power until overtensioned* 	 Replace sheaves. Tension drive properly.
	2. Improper tension	2. Retension.
 Sheaves too small 	 Motor manufacturer's sheave diameter recommendation not followed 	1. Redesign using drive manual.
 Poor bearing condition 	 Bearing underdesigned Bearing not properly maintained 	1. Check bearing design. 2. Align and lubricate bearing.
 Sheaves too far out on shaft 	1. Error or obstruction problem	 Place sheaves as close as possible to bearings. Remove obstructions
 Belt slippage 	1. Drive undertensioned	1. Retension.

Performance Problems

Symptoms	Probable Cause	Corrective Action
 Incorrect driveN speed 	1. Design error	 Use correct driveR/driveN sheave size for desired speed ratio.
	2. Belt slip	 Retension driveR. Use synchronous belt.

Problems With Banded (Joined) Belts

Symptoms	Probable Cause	Corrective Action
Tie band separation	1. Worn sheaves 2. Improper groove spacing	 Replace sheaves. Use standard groove sheaves.
• Top of tie band frayed or worn	 Interference with guard Backside idler malfunction or damaged 	1. Check guard. 2. Replace or repair backside idler
 belt comes off drive repeatedly 	 Debris in sheaves Misalignment 	 Clean grooves. Use single belts to prevent debris from being trapped in grooves. Realign drive.
 One or more "ribs" runs out of pulley 	1. Misalignment 2. Undertensioned	1. Realign drive. 2. Retension.

Problems With Synchronous Belts

Symptoms	Probable Cause	Corrective Action
 Unusual noise 	1. Misaligned drive	1. Correct alignment.
	2. Too low or high tension	2. Adjust to recommended value
	3. Backside idler	3. Use inside idler.
	4. Worn sprocket	4. Replace.
	5. Bent guide flange	5. Replace.
	6. Belt speed too high	6. Redesign drive.
	 Incorrect belt profile for sprocket (i.e. HTD, etc.) 	 Use proper belt/sprocket combi- nation.
	8. Subminimal diameter	 Redesign drive using larger diameters.
	9. Excess load	 Redesign drive for increased capacity.

Tension Loss	 Weak support structure Excessive sprocket wear Fixed (non-adjustable) centers Excessive debris Excessive load Subminimal diameter Belt, sprocket or shafts running too hot Unusual belt degradation 	 Reinforce structure. Use alternate sprocket material. Use inside idler for belt adjustment. Remove debris, check guard. Redesign drive for increased capacity. Redesign drive using larger diameters. Check for conductive heat transfer from prime mover. Reduce ambient drive temperature to 185°F maximum.
Excessive Belt Edge Wear	 Damage due to handling Flange damage Belt too wide Belt tension too low Rough flange surface finish Improper tracking Belt hitting drive guard or bracketry Misalignment 	 Follow proper handling instructions. Repair flange or replace sprocket. Use proper width sprocket. Adjust tension to recommended value. Replace or repair flange (to eliminate abrasive surface). Correct alignment. Remove obstruction or use inside idler. Realign drive
Tensile Break	 Excessive shock load Subminimal diameter Improper belt handling and storage prior to installation (crimping) Debris or foreign object in drive Extreme sprocket run-out 	 Redesign drive for increased capacity. Redesign drive using larger diameters. Follow proper storage and han- dling procedures. Remove objects and check guard. Replace sprocket.
Belt Cracking	 Subminimal diameter Backside idler Extreme low temperature at start-up. Extended exposure to harsh chemicals Cocked bushing/sprocket assembly 	 Redesign drive using larger diameter. Use inside idler or increase diameter of backside idler. Pre-heat drive environment. Protect drive. Install bushing per instructions.
Premature Tooth Wear	 Too low or high belt tension Belt running partly off unflanged sprocket Misaligned drive Incorrect belt profile for sprocket (i.e. HTD, etc) Worn sprocket Rough sprocket teeth 	 Adjust to recommended value. Correct alignment. Correct alignment. Use proper belt/sprocket combination. Replace. Replace sprocket

Problems With Banded (Joined) Belts

Symptoms	Probable Cause	Corrective Action
Tie band separation	 Worn sheaves Improper groove spacing 	 Replace sheaves. Use standard groove sheaves.
• Top of tie band frayed or worn	 Interference with guard Backside idler malfunction or damaged 	 Check guard. Replace or repair backside idler
 DNA Power[®] belt comes off drive repeatedly 	1. Debris in sheaves 2. Misalignment	 Clean grooves. Use single belts to prevent debris from being trapped in grooves. Realign drive.
One or more "ribs" runs out of pulley	 Misalignment Undertensioned 	 Realign drive. Retension.

Problems With Synchronous Belts

Symptoms	Probable Cause	Corrective Action	
Unusual noise	1. Misaligned drive	1. Correct alignment.	
	2. Too low or high tension	2. Adjust to recommended value	
	3. Backside idler	3. Use inside idler.	
	4. Worn sprocket	4. Replace.	
	5. Bent guide flange	5. Replace.	
	6. Belt speed too high	6. Redesign drive.	
	7. Incorrect belt profile for sprocket	 Use proper belt/sprocket combi- nation. 	
	8. Subminimal diameter	 Redesign drive using larger diameters. 	
	9. Excess load	 Redesign drive for increased capacity. 	

Tension Loss	 Weak support structure Excessive sprocket wear Fixed (non-adjustable) centers Excessive debris Excessive load Subminimal diameter Belt, sprocket or shafts running too hot 	 Reinforce structure. Use alternate sprocket material. Use inside idler for belt adjustment. Remove debris, check guard. Redesign drive for increased capacity. Redesign drive using larger diameters. Check for conductive heat transfer from prime mover.
	8. Unusual belt degradation	 Reduce ambient drive tempera- ture to 185°F maximum.
Excessive Belt Edge Wear	 Damage due to handling Flange damage Belt too wide Belt tension too low Rough flange surface finish 	 Follow proper handling instructions. Repair flange or replace sprocket. Use proper width sprocket. Adjust tension to recommended value. Replace or repair flange (to eliminate abrasive surface).
	 6. Improper tracking 7. Belt hitting drive guard or bracketry 8. Misalignment 	 6. Correct alignment. 7. Remove obstruction or use inside idler. 8. Realign drive
Tensile Break	 Excessive shock load Subminimal diameter Improper belt handling and storage prior to installation (crimping) Debris or foreign object in drive Extreme sprocket run-out 	 Redesign drive for increased capacity. Redesign drive using larger diameters. Follow proper storage and han- dling procedures. Remove objects and check guard. Replace sprocket.
Belt Cracking	 Subminimal diameter Backside idler Extreme low temperature at start-up. Extended exposure to harsh chemicals Cocked bushing/sprocket assembly 	 Redesign drive using larger diameter. Use inside idler or increase diameter of backside idler. Pre-heat drive environment. Protect drive. Install bushing per instructions.
Premature Tooth Wear	 Too low or high belt tension Belt running partly off unflanged sprocket Misaligned drive Incorrect belt profile for sprocket Worn sprocket Rough sprocket teeth 	 Adjust to recommended value. Correct alignment. Correct alignment. Use proper belt/sprocket combination. Replace. Replace sprocket

Tension Gauge

Improper belt tension, either too high or too low, can cause belt drive problems. Several types of tension gauges are available; see page 35. An inexpensive pencil type is adequate for most situations. See your local DNA distributor for price and availability.

Vibrotach Tachometer

This tool can be used to isolate the forcing frequency behind vibration problems. It is a small, hand-held device which can be butted up against the vibrating equipment. A thin metal reed protrudes from the end, the length of which can be varied. As you vary the length, the reed will vibrate wildly at some point. The tachometer scale then gives you the forcing rpm or frequency. Once the system frequencies are identified, it is easy to trace and correct the source of the problem.

Dial Indicator

Improperly mounted sheaves or outof-round pulleys are sometimes the root of vibration or more severe problems. This device can be used to measure side-to-side sheave wobble or diameter variation by holding it up to the sheave sidewall or top of the belt inside the pulley groove, respectively. IMPORTANT: Always turn off the machine before using the dial indicator. Rotate the drive by hand to make your measurements.

Clamp-On Ammeter

If belts are failing prematurely, it's possible the driveN load was underestimated when the drive was designed. Use the ammeter to check the actual load being delivered by an electric motor. The clamp-on style allows you to do this safely, without baring wires or worrying about electrical connections.

This tool also can be used to troubleshoot vibration problems if they are caused by electrical sources such as arcing switches, power surges or electrical connections.

Needle Pyrometer

The pyrometer allows you to accurately measure internal and external belt temperatures.

Strobe Tachometer

You cannot always see what is happening to a drive while it is in operation. This instrument allows you to stop the action to get a better idea of the dynamic forces affecting the drive. The strobe tachometer is best used after initial diagnosis of the problem because it helps pinpoint the cause. It will help you identify such things as single or dual mode belt span vibration and frame flexure.

DotLine Laser Tool

- · Compact design
- Includes an adjustable pivoting mounting arm
- Laser projects either a dot or a line
- Laser line is very easy to read on targets
- Adjustable targets for custom sheave/sprocket edge thickness available
- Includes a hard foam filled plastic carrying case

Premature Tooth Wear –cont.	 Damaged sprocket Sprocket not to dimensional specification Belt hitting drive bracketry or other structure Excessive load Insufficient hardness of sprocket material Excessive debris Cocked bushing/sprocket assembly 	 Replace. Replace. Remove obstruction or use idler Redesign drive for increased capacity Use a more wear-resistant sprocket Remove debris, check guard. Install bushing per instructions.
Tooth Shear	1. Excessive shock loads	1. Redesign drive for increased
UMMM	 Less than 6 teeth-in-mesh Extreme sprocket run-out Worn sprocket Backside idler Incorrect belt profile for the sprocket Misaligned drive Belt undertensioned 	 2. Redesign drive. 3. Replace sprocket. 4. Replace. 5. Use inside idler 6. Use proper belt/sprocket combination. 7. Realign. 8. Adjust tension to recommended value.
Flange Failure	1. Belt forcing flange off	1. Correct alignment or properly secure flange to sprocket.
Unusual Sprocket Wear	 Sprocket has too little wear resistance (i.e. plastic, aluminum, soft metals) Misaligned drive Excessive debris Excessive load belt tension too low or high Incorrect belt profile 	 Use alternate sprocket material. Correct alignment. Remove debris, check guard. Redesign drive for increased capacity. Adjust tension to recommended value. Use proper belt/sprocket combi- nation.
Belt Tracking	 Belt running partly off unflanged sprocket Centers exceed 8 times small sprocket diameter and both sprockets are flanged. Excessive belt edge wear 	 Correct alignment. Correct parallel alignment to set belt to track on both sprockets. Correct alignment.
Excessive Temperature (Belt, Bearing, Housing, Shafts, etc.)	 Misaligned drive Too low or high belt tension Incorrect belt profile 	 Correct alignment. Adjust tension to recommended value. Use proper belt/sprocket combi- nation.
Shafts Out of Sync	1. Design error 2. Incorrect belt	 Use correct sprocket sizes. Use correct belt with correct tooth profile for grooves.
Vibration	 Incorrect belt profile for the sprocket Too low or high belt tension Bushing or key loose 	 Use proper belt/sprocket combination. Adjust tension to recommended value. Check and reinstall per instructions.

TROUBLESHOOTING TOOLS

You are faced with a problem drive and must determine the cause. The tools available to help you troubleshoot range from the surprisingly simple to complicated. Following is a list of tools you can use to effectively diagnose a problem. While DNA does not sell most of the items discussed in this section, unless noted, the items are readily available from industrial instrumentation outlets throughout the United States.

Eyes, Ears, Nose & Hands

When troubleshooting a belt drive problem, stand back and observe the drive while it is in operation and at rest. Do you smell warm rubber? Can you see anything unusual about the way the belt travels around the drive? Is the drive frame flexing under load? Do you hear chirping, squealing or grinding noises? Is there an accumulation of fabric dust beneath the drive which might interfere with the belts?

Squirt Bottle With Soapy Water

When a belt drive is excessively noisy, the belt is often incorrectly blamed. It is easy to eliminate the belt as the problem by spraying it with soapy water while it is running. If the noise goes away, or decreases, then the belt is part of the problem. If you still hear the same noise, the problem is likely due to other drive components.

Ball Of String

Variation in drive center distance, often caused by weak supporting structure, can cause problems from vibration to short belt life. To determine if center distance variation exists, turn off the drive and tightly tie a piece of string from the driveR to the driveN shaft.Start up the drive and note if the string stretches almost to the point of breaking, or goes slack. If either is the case, the problem could be center distance variation. It is particularly important to observe the string right at drive start up when the loads are highest. String can also be used to check pulley alignment.

Belt & Sheave Groove Gauges

If you suspect a belt-to-sheave groove mismatch, English and metric belt and sheave groove gauges can be used to check dimensions. These also are handy for identifying a

belt cross section for replacements and for checking sheave grooves for wear.

These gauges are available from your belt supplier For price information, contact your Dna distributor.

English Gauge: Form #13998 Metric Gauge: Form #13998-M

Long Straight Edge

While V-Belts can be somewhat forgiving of misalignment, this condition can still affect V-Belt performance. Even slight misalignment can cause major problems on a synchronous drive.Use a long straight edge, made of wood, metal or any rigid material, to quickly check drive alignment. Simply lay the straight edge across the pulley faces and note the points of contact (or lack of contact).

Design Dna [®] and Design View [®]

Dna design suite of engineering programs include interactive support software and a user friendly interface for rapid data retrieval and smooth design work.

NOTE: In some cases redesign of the drive is necessary. Dna Drive Design software provides a quick, accurate and flexible method of correctly redesigning problem drives.

TECHNICAL INFORMATION

Poly Chain® GT2® Installation & Tensioning Allowances

Center Distance Allowance For Installation and Tensioning

Ratdard Installation Allowance (Flagged Sproclasis Removed Per Installation) Terretoning Alternaço (Any Orito) 3eX Length 40° and under 0.07* 0.03° (1000mm and 1.J. 📖 48 m Over 40* 10 70* 0.11* 0.03× (Cver 1000mm 2.6 mm 0.8 m to 1750mm) Over 70" to 100* 0.13* 0.04 (Over 1750mm 8.5 1.0 m to 2540mm)

Over 100* to 1**50*** 0.16 0.04* (Over 2540mm 4.1ma 1.0en to 3300(mm) Over 150* to 180* 0.21* 106 (Dvar 3300 mm to 4800mmh 1.**2** m 6.3mm

Additional Center Distance Allowance For Installation Over Flanged Sprocket*

(Add to Installation Allowance in Above Table)

Bailt Phich	Cae Epicaleri Flanged	Bath Sproeksto Flanged
ânm	0.00*	1.31*
8mm	21.8 m	33.3 m
14mm	1.25*	1.87*
14mm	81.2 m	50.0m

* For drives their require installation of the belt over one special at a time, use the value for both sprockets llenged, even if only one sprocket is llenged.
